Build a browser-based planning assistant with three guided workflows: home interiors, parties and jewelry.

User Flow

1. Register and log in.
2. Open the dashboard and choose a planner.
3. Enter a budget and category-specific preferences.
4. The app asks Google Gemini for a structured JSON plan. If Gemini is not configured, fails, or returns an invalid or over-budget result, a rule-based offline plan is returned.
5. The plan is saved for the user and shown with category allocations, item estimates and tips.
6. Review or clear saved plans on the History page.

Key Features

- Home, Party and Jewelry planners
- Optional outfit-image input for jewelry (JPEG, PNG or WebP, up to 5 MB)
- Register, login and logout using bcrypt and JWT in an HttpOnly cookie
- Per-user recommendation history stored in SQLite
- Offline fallback and escaped output
