

Project Overview

PocketSmart AI | Team ID 6aba1a835015c35b98635933 | Team Leader: Rohith S | Members: Heedhesh R, Ashwin S, Chandru T

PocketSmart AI is a FastAPI web application that helps users plan spending for home interiors, parties and jewelry. Users register, log in, enter a budget and preferences, and receive a structured plan with category allocations, item estimates and tips.

Components

- FastAPI provides page and API routes.
- Jinja2 templates, CSS and JavaScript provide the interface.
- Feature routers handle auth, home, party and jewelry requests.
- Google Gemini generates plans when configured; a rule-based engine is the fallback.
- SQLite stores users and each user's saved recommendations.

Scenarios

1. **Home:** Rs. 2,00,000 budget, living room and bedroom, modern style. The plan splits money across furniture, lighting, storage and decor, plus contingency.
2. **Party:** a birthday for 40 guests with catering, decoration and photography. The budget is split across services with a contingency.
3. **Jewelry:** a wedding, gold necklace and earrings, optional outfit photo. Suggestions come with estimated prices and buying tips.

Generated prices are estimates and should be checked with sellers.
